This Whirlpool Service Manual, (Part No. W11169659), provides the In-Home Service Professional with service information for the “WHIRLPOOL & MAYTAG 27” FRONT-LOAD GAS & ELECTRIC DRYERS.”

The Wiring Diagram used in this Service Manual is typical and should be used for training purposes only. Always use the Wiring Diagram supplied with the product when servicing the dryer.

For specific operating and installation information on the model being serviced, refer to the “Use and Care Guide” or “Installation Instructions” provided with the dryer.

GOALS AND OBJECTIVES

The goal of this Service Manual is to provide information that will enable the In-Home Service Professional to properly diagnose malfunctions and repair the “WHIRLPOOL & MAYTAG FRONT-LOAD DRYERS.”

The objectives of this Service Manual are to:

• Understand and follow proper safety precautions.
• Successfully troubleshoot and diagnose malfunctions.
• Successfully perform necessary repairs.
• Successfully return the dryer to its proper operational status.

WHIRLPOOL CORPORATION assumes no responsibility for any repairs made on our products by anyone other than authorized In-Home Service Professionals.

Dryer Safety

Your safety and the safety of others are very important.

We have provided many important safety messages in this manual and on your appliance. Always read and obey all safety messages.

This is the safety alert symbol.

This symbol alerts you to potential hazards that can kill or hurt you and others.

All safety messages will follow the safety alert symbol and either the word "DANGER" or "WARNING."

These words mean:

**DANGER**
You can be killed or seriously injured if you don’t immediately follow instructions.

**WARNING**
You can be killed or seriously injured if you don’t follow instructions.

All safety messages will tell you what the potential hazard is, tell you how to reduce the chance of injury, and tell you what can happen if the instructions are not followed.
Whirlpool Control Panel & Features (HMI in Door)

Not all features and cycles are available on all models.

NOTE: The control panel features a sensitive surface that responds to a light touch of your finger. To ensure your selections are registered, touch the control panel with your fingertip, not your fingernail. When selecting a setting or option, simply touch the appropriate button.

1. POWER/CANCEL BUTTON
   Touch to turn the dryer on or off or to cancel a cycle.

2. HOME BUTTON
   Touch this button and the LCD screen will show the home screen, where you can select your cycle, settings, and options.

3. FAVORITES BUTTON
   Stores and accesses your favorite cycles, and also accesses a history of recently run cycles.

4. LCD SCREEN
   Use this screen to select cycle, settings, options, etc. Swiping the screen gives access to five frequently run cycles.

5. REMOTE ENABLE BUTTON
   Download the Whirlpool® app and follow the instructions to connect your dryer to your home Wi-Fi network. You may also visit www.whirlpool.com/connect. In Canada, visit www.whirlpool.ca/connect. After having connected to Wi-Fi, press the REMOTE ENABLE button any time you want to use the app. Pressing this button locks out the LCD screen and you will be prompted with a message about the dryer waiting for input from the app. To exit this mode, press the REMOTE ENABLE button again.

6. TOOLS BUTTON
   Touch this button to access the Tools screen.

7. START/PAUSE BUTTON
   Touch and hold to start, or touch to pause a cycle. When the dryer drum begins to move, release the START/PAUSE button. Continuing to hold the Start/Pause button after the dryer has started will cause the dryer to stop.

The Tools button gives access to many other settings, utility cycles, preferences, and information. Touch the TOOLS button to access the Tools screen, which contains the following (you will need to scroll down with your finger to access all of the selections).

Control Lock
Press this icon to lock the controls. Swipe up to unlock.

Mute
Press this icon to mute or unmute sounds.

Utility Cycle
Press this icon to access utility cycles: Rinse, Spin, Drain, Clean Cycle.

Steam Refresh
Select Steam Refresh to reduce odors and light wrinkles in dry loads consisting of wrinkle-free cotton, cotton-polyester blends, common knits, and synthetics. If you will be unable to remove a load immediately, touch WRINKLE SHIELD to add up to 150 minutes of periodic tumbling. You may select the + Steam setting to add a short steam cycle after 60 minutes to help smooth out wrinkles.

Preferences
Press to access Times and Dates, Sound Volume, Display Settings, and Regional. Follow the screen prompts.

WiFi
Press to access Connect to Network, SAID Codes, Mac Address, and WiFi. Follow the screen prompts.

Info
Press to access Service & Support, Store Demo Mode, Restore Factory, WiFi Terms and Conditions, and Software Terms and Conditions. Follow the screen prompts.
Whirlpool Control Panel & Features (Console)

Not all features and cycles are available on all models.

NOTE: The control panel features a sensitive surface that responds to a light touch of your finger. To ensure your selections are registered, touch the control panel with your fingertip, not your fingernail. When selecting a setting or option, simply touch the appropriate button.

STEAM MODELS

1. **POWER**
   Touch to turn the dryer on and off. Touch to stop/cancel a cycle at any time.

2. **WHAT TO DRY/HOW TO DRY**
   Once a “What to Dry” is selected, the dryer automatically selects the recommended or last-used “How to Dry” option, as well as the recommended/last-used modifiers. Both the “How to Dry” and modifiers can be changed if desired. See the “Cycle Guide” for details.

3. **START/PAUSE**
   Touch and hold until LED counts down “3-2-1” and the dryer starts; then let go to start a cycle, or touch once while a cycle is in process to pause it.

4. **MODIFIERS**
   Use to select available modifiers for your dryer. Not all cycles and options are available on all models.

   - **Temp**
     When using Timed Dry/Quick Cycle, you may select a dry temperature based on the type of load you are drying. Use the warmest setting that is safe for the garments in the load. Follow garment label instructions.

   - **NOTE**: Automatic Cycles will give you up to four temperatures to adjust, depending on the model and the “What to Dry” or “How to Dry” selections that have been made.

   - **Dryness**
     You may adjust the Dryness on Automatic Cycles (except for the Sanitize cycle), if desired.

     - **NOTE**: Dryness is for use with Automatic Cycles only.

5. **OPTIONS**
   Use to select available options for your dryer. Not all cycles and options are available on all models.

   - **Wrinkle Shield™ Option**
     If you will be unable to remove a load immediately, touch WRINKLE SHIELD™ to add up to 150 minutes of periodic tumbling to help reduce wrinkling. You may select the “+ Steam” setting (on some models) to add a short steam cycle after 60 minutes to help smooth out wrinkles.

     - **NOTE**: If you open the dryer door prior to the end of the Wrinkle Shield™ option, the dryer will go into standby.

   - **Steam Refresh (steam models only)**
     This cycle is best for reducing wrinkles and odors from dry items. Cycle time will increase, depending on number of items. This is an independent cycle that cannot be combined with any other cycle.

   - **Cycle Signal**
     Use this option to turn the signal indicating the end of a drying cycle to low, medium, high, or off. The volume you select here will also be applied to the Damp Dry Signal.

     - **NOTE**: You may also turn off the tones that sound when a feature, setting, or option is touched. Touch and hold CYCLE SIGNAL for about 3 seconds to turn sounds to low, medium, high, or off.

More Time/Less Time Timed Dry Adjust
Touch MORE TIME or LESS TIME with the Timed Dry/Quick cycle to increase or decrease the length of the cycle.

NON-STEAM MODELS
Whirlpool Control Panel & Features (Console) continued

**Damp Dry Signal**
Touch to turn the Damp Dry Signal on or off. When selected, a series of beeps will sound when the load is damp, but not completely dry. This option is available on some cycles. The Damp Dry signal is selected as a default for the Bulky Items/Normal, Bulky Items/Wrinkle Control, and Bulky Items/Heavy Duty cycles, as a reminder to manually reposition bulky loads midway through the cycle.

**Reduce Static (on some models)**
Touch to add the Reduce Static option to selected Automatic cycles. The dryer will automatically tumble, pause, and introduce a small amount of moisture into the load to help reduce static. This option adds approximately 3 minutes to the total cycle time.

**Control Lock**
Use this option to lock the controls of the dryer and avoid an accidental change in cycle options or preferences during a drying cycle.

Touch and hold CONTROL LOCK or DAMP DRY SIGNAL (depending on the model) for 3 seconds to lock or unlock the controls of the dryer. During this time, the LED Display will count down “3-2-1.” Once the controls are locked, the LED Display will display “Loc.”

**NOTE:** The Control Lock function may be enabled when recovering from a power failure. To unlock the control, touch and hold CONTROL LOCK or DAMP DRY SIGNAL (depending on the model) for at least 3 seconds.

**EcoBoost™ Option**
The EcoBoost™ option will default on only for the Regular/Normal cycle and is only available on that cycle. This option allows you to increase your energy savings by using a slightly lower heat level. The EcoBoost™ option will increase drying times by approximately 40 minutes, which will be reflected on the LED Display. If optimal time is desired, touch ECOBOOST to turn off this option.

**LED DISPLAY**
When you select a cycle, its default settings will light up and the Estimated Time Remaining (for Automatic Cycles) will vary depending on “What to Dry” and “How to Dry” selections, or actual time remaining for Timed Dry cycles (for Manual Cycles) will be displayed.

**CYCLE STATUS INDICATORS**

<table>

The Cycle Status Indicators show the progress of a cycle. Not all indicators are available on all models.
NOTE: Not all features and cycles are available on all models.

The control panel features a sensitive surface that responds to a light touch of your finger. To ensure your selections are registered, touch the control panel with your fingertip, not your fingernail. When selecting a setting or option, simply touch the appropriate button.

**POWER/CANCEL**
Touch to turn the dryer on and off. Touch to stop/cancel a cycle at any time.

**CYCLE CONTROL KNOB**
Turn the knob to select a cycle for your laundry load. Sensor Cycles are Custom Cycle, Bulky Items, Towels, Sanitize, Whites, Heavy Duty, Regular, Delicates, Wrinkle Control, Normal, and Jeans. Timed Cycles are Timed Dry and Quick Dry. The Steam Cycle (on some models) is Steam Refresh. See “Cycle Guide” for detailed descriptions of cycles. The Cycle Control Knob can also be pressed to activate the Extra Power option for harder-to-dry loads. See the “Options” section for more information.

**START/PAUSE**
Touch and hold until the LED counts down “3-2-1” and the dryer starts, or touch once while a cycle is in process to pause it.

**LED DISPLAY AND SETTINGS**
When you select a cycle, its settings will light up and the Estimated Cycle Time (for Sensor Cycles) or actual time remaining (for Timed Cycles) will be displayed.

**OPTIONS**
Use to select available options for your dryer. Not all cycles and options are available with all cycles.

- **Wrinkle Prevent**
  (See Whirlpool Control Panel Options, “Wrinkle Shield Option”, on page 1-4.)
Maytag Control Panel & Features (Console) continued

Reduce Static
(See Whirlpool Control Panel Options, on pages 1-4 & 5.)

Steam (steam models only)
(See Whirlpool Control Panel Options, on pages 1-4 & 5.)

Cycle Signal
Use this to turn the signal indicating the end of a drying cycle on or off. Touch CYCLE SIGNAL or touch and hold REDUCE STATIC for 3 seconds to turn sounds on or off.

Control Lock
Use to lock the controls of the dryer and avoid an accidental change in cycle options or preferences during a drying cycle. Touch and hold CONTROL LOCK or STEAM for 3 seconds to lock or unlock the controls of the dryer. During this time, the LED Display will count down “3-2-1.” Once the controls are locked, the Control Lock icon will illuminate.

NOTE: The Control Lock function may be enabled when recovering from a power failure. To unlock the control, touch and hold CONTROL LOCK or STEAM for at least 3 seconds.

Extra Power
The Extra Power option can be used with both Sensor and Timed Dry Cycles. Press the Cycle Control Knob to activate the Extra Power option, which provides an additional 10 minutes of cycle time (including additional heat and tumbling, where applicable). When Extra Power is activated, the Cycle Control Knob will illuminate and the estimated time remaining on the display will show an additional 10 minutes.

6 CONNECTIVITY
Use to select available connectivity options for your dryer. Not all cycles and options are available on all models. Download the Whirlpool® app and follow the instructions to connect your dryer to your home Wi-Fi network. You may also visit www.whirlpool.com/connect.

WiFi Connect
Touch and hold WIFI CONNECT for 3 seconds during the initial connection of the dryer to your home Wi-Fi network. If the dryer is in a Smart Delay, touch WIFI CONNECT to override the delay and begin a dry cycle immediately.

Remote Enable
To start a dryer cycle remotely from the Whirlpool® app, touch REMOTE ENABLE. The Remote Enable status indicator will begin blinking. Select the desired cycle, cycle settings, and options. Touch and hold START/PAUSE to set the Remote Enable. The Remote Enable status indicator will be solidly lit.

NOTE: Any interaction with the dryer once a Remote Enable has been set will cause the Remote Enable to cancel.

7 CYCLE AND CONNECTED STATUS INDICATORS

The Cycle Status Indicators show the progress of a cycle. The Connected Status Indicators show the connected status. Not all indicators are available on all models.

Sensing
The Sensing indicator will light during Sensor Cycles to indicate that the moisture sensor on the dryer is operating. This indicator will not light during Timed Cycles or options such as Wrinkle Prevent.

Wet
The load is still wet and/or the cycle just started.

Damp
The load still has moisture remaining, a good point in the cycle to remove a garment to air dry or iron.

Cool Down
The dryer has finished drying with heat and is now tumbling the load without heat to cool it down and reduce wrinkling.

Check Vent
The Check Vent indicator is a feature available for Sensor Cycles only. This indicator will show the status of airflow through the dryer and the dryer vent system for the dryer’s life. This feature is available during Sensor and Steam Cycles only. During the sensing phase at the beginning of the cycle, the Check Vent light will come on if a blocked vent or low airflow issue is detected. This light will stay on for the entire cycle. Should the Check Vent light illuminate, refer to the “Troubleshooting” section for potential solutions to the issue.

The light will be cleared upon completion of the cycle, touching Power/Cancel, or opening the door after the cycle has completed. Although the light will be cleared at the beginning of a cycle, it will continue to illuminate during the cycle unless the root cause is resolved.

NOTE: The dryer will continue to operate even while the indicator is lit, but poor airflow can impact dry times and overall performance. For more information on maintaining good airflow, see “Check Your Vent System for Good Airflow.” If there are other error issues during a cycle, the Check Vent indicator will not light up. See the “Troubleshooting” section.

End
This will indicate that the selected cycle has ended and the load may be removed from the dryer. If Wrinkle Prevent has been selected, the dryer may continue to tumble the load, even if “End” is showing in the display.

Control Lock
This will illuminate when the controls are locked.

NOTE: The Control Lock function may be enabled when recovering from a power failure. To unlock the control, touch and hold STEAM for at least 3 seconds.

Connected
This will illuminate when the dryer is connected to the internet.

Smart Delay
This will illuminate when a smart delay is in effect: the operation of the dryer has been delayed to a time when lower utility rates are in effect.

Diagnostic Guide

Before servicing, check the following:

- Make sure there is power at the wall outlet.
- Has a household fuse blown or circuit breaker tripped? Was a regular fuse used? Inform customer that a time-delay fuse is required.
- Is dryer vent properly installed and clear of lint or obstructions?
- All tests/checks should be made with a VOM (volt-ohm-milliammeter) or DVM (digital-voltmeter) having a sensitivity of 20,000 Ω per volt DC or greater.
- Resistance checks must be made with dryer unplugged or power disconnected.
- IMPORTANT: Avoid using large diameter probes when checking harness connectors as the probes may damage the connectors upon insertion.
- Check all harnesses and connections before replacing components. Look for connectors not fully seated, broken or loose wires and terminals, pin insertion, or wires not pressed into connectors far enough to engage metal barbs.
- A potential cause of a control not functioning is corrosion or contamination on connections. Use an ohmmeter to check for continuity across suspected connections.

Service Diagnostic Mode

These tests allow service personnel to test and verify all inputs to the machine control electronics. You may want to do a quick and overall checkup of the dryer with these tests before going to specific troubleshooting tests.

Activating Service Diagnostic Mode

1. Be sure the dryer is in standby mode (plugged in with all indicators off).
2. Select any three (3) buttons (except POWER and START) and follow the steps below, using the same buttons (remember the buttons and the order that the buttons were pressed):

   Within 8 seconds,
   • Press and Release the 1st selected button,
   • Press and Release the 2nd selected button,
   • Press and Release the 3rd selected button;
   • Repeat this 3 button sequence 2 more times.

3. If this test mode has been entered successfully, all indicators on the console will be illuminated for 5 seconds with “888” showing in the three-digit display and a tone will sound. If there are no saved fault codes, all indicators on the console will momentarily turn off, and then only the seven-segment display will come back on and display “888.”

   NOTE: The Service Diagnostic mode will time out after 10 minutes of user inactivity, or shut down if AC power is removed from the dryer.

   Unsuccessful Activation

   If entry into diagnostic mode is unsuccessful, refer to the following indications and actions:

   Indication 1: None of the indicators or display turn on.
   Action:
   If indicators come on, try to change the function for the three buttons used to activate the diagnostic test mode. If any button is unable to change the function, something is faulty with the button, and it will not be possible to enter the diagnostic mode using that button. Replace the HMI and housing assembly.
   If no indicators come on after selecting the cycle, go to TEST #1, ACU Power Check, page 3-8.

   Indication 2: Console indicators begin flashing immediately.
   Action:
   If console indicators begin flashing on and off immediately, replace the HMI.

   Activation with Saved Fault Codes

   If there is a saved fault code, it will be flashing in the display. Review the Fault/Error Codes table on page 2-11 for the recommended procedure. If there is no saved fault code, “888” will be displayed.

   • See “Activating Service Diagnostic Mode” to activate these functions. Make sure all of step 3 is complete before activation.

KEY ACTIVATION & ENCODER TEST

NOTE: The Service Diagnostic mode must be activated before entering the Key Activation & Encoder Test; see procedure on page 2-4.

Active Fault Code Display In Key Activation & Encoder Test
If the display begins flashing while in the Key Activation & Encoder Test, it is displaying an active fault code. Active fault codes are codes that are currently detected. Only one active fault code can be displayed at a time.

Entry Procedure
Press and release the 1st button used to activate Service Diagnostic mode. The following test will be available:

DIAGNOSTIC: Key Activation & Encoder Test
Pressing each button will turn off its corresponding indicator(s) or display segment and sound a beep (see figure 1 or 2, pages 2-2 and 2-3.)
On some models, rotating the cycle selector knob turns off the Extra Power light.

NOTE: A second press of the POWER button while in Key Activation & Encoder Test mode exits the Service Diagnostic mode and returns the dryer to standby mode.

Exit Procedure
To exit Key Activation & Encoder Test, press the POWER button once or twice (depending on diagnostic procedure) or press and hold the 1st button used to activate Service Diagnostic mode.

SERVICE TEST MODE

NOTE: The Service Diagnostic mode must be activated before entering Service Test Mode; see procedure on page 2-4.

NOTE: If, at any point, the user presses the POWER button or opens the door during Service Test Mode, the dryer exits to standby mode.

Active Fault Code Display in Service Test Mode
If the display begins flashing while in Service Test Mode, it is displaying an active fault code. Active fault codes are codes that are currently detected. Only one active fault code can be displayed at a time.

Entry Procedure
To enter Service Test Mode, press and release the 2nd button used to activate the Service Diagnostic mode. All LEDs (except for POWER) turn off, “888” is displayed for 2 seconds, and the START button begins to flash.

PERFORM ALL TESTS: Press and release the START button to run all tests indicated in the chart below and on page 2-6.

VOLTAGE AND WATER SYSTEM-ONLY TESTS: Press and hold the START button for 5 seconds after step 3 to run only the voltage and water system tests.

Exit Procedure
When the test is complete, press the POWER button to exit Service Test Mode and return to standby mode.

SOFTWARE VERSION DISPLAY

NOTE: The Software Version Display mode will time out after 10 minutes of user inactivity and return to standby mode.

Entry Procedure
To enter Software Version Display, press and hold the 2nd button used to activate the Service Diagnostic mode for 5 seconds. Upon entry, the display will automatically cycle through the following information:

- ACU Firmware revision code (C: major revision number, C: minor revision number, C: test revision number)
- ACU Settings File revision code (S: flashes 4 times, each time showing 2 digits of the 8-digit number)
- HMI Application Firmware revision code (U: major revision number, U: minor revision number, U: test revision number)
- HMI Touch Firmware revision code (t: major revision number, t: minor revision number, t: test revision number)
- HMI Audio Firmware revision code (A: major revision number, A: minor revision number, A: test revision number)

Exit Procedure
Pressing the POWER button will exit Software Version Display and return dryer to standby mode.

FAULT/ERROR CODES
Refer to customer diagnostic codes and service fault/error codes on page 2-11.

Fault/Error Code Display Method
Fault codes are displayed by alternately showing F# and E#. All fault codes have an F# and an E#. The F# indicates the suspect System/Category. The E# indicates the suspect Component system.

Up to five Fault/Error codes may be stored. When the oldest fault code is displayed, additional presses of the 3rd button will result in a triple beep, then display of the most recent fault code. If each press of the 3rd button results in a triple beep and the display shows “888”, no saved fault codes are present.

Advancing Through Saved Fault/Error Codes
Procedure for advancing through saved fault codes:

<table>
<thead>
<tr>
<th>Press and release the 3rd button used to activate Service Diagnostics</th>

</tr>
</thead>
<tbody>
<tr>

<td>fifth most recent fault code is displayed</td>
</tr>
<tr>
<td>Repeat</td>
<td>triple beep</td>
<td>back to the most recent fault code</td>
</tr>
</tbody>
</table>

Clearing Fault Codes
To clear stored fault codes, enter Service Diagnostic mode. Then press and hold the 3rd button used to enter Service Diagnostic mode for 5 seconds. Once the stored fault codes are successfully erased, the seven segment display will show “888” and a beep will sound.

EXITING SERVICE DIAGNOSTIC MODE
Use either of the two methods below to exit diagnostic mode:

- Pressing and holding the 1st button used to activate the Service Diagnostic mode for 5 seconds.
- Pressing the POWER button once or twice, depending on diagnostic procedure.

**DIAGNOSTIC GUIDE**
Before servicing, check the following:
- Make sure there is power at the wall outlet.
- Has a household fuse blown or circuit breaker tripped? Was a regular fuse used? Inform customer that a time-delay fuse is required.
- Is dryer vent properly installed and clear of lint or obstructions?
- All tests/checks should be made with a VOM (volt-ohm-milliammeter) or DVM (digital-voltmeter) having a sensitivity of 20,000 Ω per volt DC or greater.
- Resistance checks must be made with dryer unplugged or power disconnected.
- IMPORTANT: Avoid using large diameter probes when checking harness connectors as the probes may damage the connectors upon insertion.
- Check all harnesses and connections before replacing components. Look for connectors not fully seated, broken or loose wires and terminals, pin insertion, or wires not pressed into connectors far enough to engage metal barbs.
- A potential cause of a control not functioning is corrosion or contamination on connections. Use an ohmmeter to check for continuity across suspected connections.

**SERVICE DIAGNOSTIC MODE**
These tests allow service personnel to test and verify all inputs to the machine control electronics. You may want to do a quick and overall checkup of the dryer with these tests before going to specific troubleshooting tests.

**ACTIVATING SERVICE DIAGNOSTIC MODE**
**IMPORTANT**: Use Service Diagnostic Mode without laundry in the dryer.

1. Be sure the dryer is in standby mode (plugged in with all indicators off).
2. Open and close the dryer door.
3. Press the POWER until the dryer display turns on. After a few seconds, the home screen will display.
4. Press the **TOOLS** button.
5. From the TOOLS menu, scroll down to “INFO.”
6. From the INFO menu, select “SERVICE & SUPPORT.”
7. From the SERVICE INFO screen, press and hold the **DIAGNOSTICS** button until the “ENTER PASSWORD” screen is displayed.
8. From the ENTER PASSWORD screen, input “123, 123,” and press “ENTER.”
9. The WARNING DIAGNOSTIC MODE screen will display. Touch **ENTER** to enter diagnostic mode. The **DIAGNOSTIC HOME** screen will be displayed. To continue with the tests in Service Diagnostic Mode, see page 2-9.

**Activation with Saved Fault Codes**
If there is a saved fault code, the F number will be shown in the display. Review the Fault/Error Codes beginning on page 2-11 for the recommended procedure and how to display saved error codes.

**Exit Procedure**
To exit the Service Diagnostic Mode Tests, scroll to the top of the **DIAGNOSTICS HOME** screen, press the “<” button in the top left corner of the screen twice, and then press the **HOME** button.
**NOTE**: Service Diagnostic Mode times out after 5 minutes of user inactivity.

**DANGER**

Electrical Shock Hazard
Only authorized technicians should perform diagnostic voltage measurements.
After performing voltage measurements, disconnect power before servicing.
Failure to follow these instructions can result in death or electrical shock.

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

**Voltage Measurement Safety Information**

When performing live voltage measurements, you must do the following:
- Verify the controls are in the off position so that the appliance does not start when energized.
- Allow enough space to perform the voltage measurements without obstructions.
- Keep other people a safe distance away from the appliance to prevent potential injury.
- Always use the proper testing equipment.
- After voltage measurements, always disconnect power before servicing.

**SERVICE DIAGNOSTIC MODE TESTS**

**NOTE:** The Service Diagnostic Mode must be activated before performing the tests; see procedure on this page.

The following section describes components that may be turned on and off to help with troubleshooting certain issues.

**IMPORTANT:** Turn off power or disconnect dryer before attaching test leads. Be sure test leads are attached prior to component activation.

To check voltage measurements, the following steps must be followed:
1. Unplug dryer or disconnect power.
2. Connect voltage measurement equipment to appropriate connectors.
3. Plug in dryer or reconnect power and confirm voltage reading.
4. After performing voltage measurements, unplug dryer or disconnect power.

**Active Fault Code Display in Quick Service Cycle**

If the display begins flashing while running a Quick Service Cycle, it is displaying an active fault code. Active fault codes are codes that are currently being detected. Only one active fault code can be displayed at a time.

From the DIAGNOSTICS HOME screen:

- Error Diagnostic
- Clear Error History
- Component Activation
- WiFi

**Figure 1**

Scroll down and select “Component Activation”

- Clear Error History
- **Component Activation**

Continued on following page . . .
Component Activation
To enter the Service Test Mode from the Component Activation menu, press “START” to begin the diagnostic test (see Figure 3). Perform the “Actions” listed in the chart below to advance through each step in the Service Test Mode.

NOTE: If, at any point, the user presses the POWER button during the Service Test Mode, the dryer exits to standby mode.

PERFORM ALL TESTS: Complete all tests listed in the Service Test Mode chart below. At the completion of all the tests, the Human-Machine Interface (HMI) will respond an overall status of PASSED or FAILED.

Exit Procedure
When the test cycle is complete, press the POWER button to exit Service Test Mode and return to standby mode.

NOTE: The drum must be empty during this test.

### Service Fault/Error Codes

#### Fault/Error Code Display Method

Fault codes are displayed by showing F#E#. The F# indicates the suspect System/Category. The E# indicates the suspect Component system.

The fault codes below may be indicated under various conditions and can be accessed through Service Diagnostics.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Explanation and Recommended Procedure</th>
</tr>
</thead>
</table>
| F1E1 | Motor or Heater Failure or Connector Problem | Indicates no voltage detected at the heater relay.  
  - Unplug dryer or disconnect power and check that the wires are plugged into the heater element(s) and the relay(s) on the ACU.  
  - For motor check, see Test #3: Motor Circuit, page 3-12. |
| F3E1 | Exhaust Thermistor Open/Shorted | Indicates that the exhaust thermistor is open or shorted. If the temperature drops below 18° F (> 50k ohms), the exhaust thermistor is open. If the temperature is above 250° F (< 500 ohms), the exhaust thermistor has shorted. May occur if the J14 connector is not plugged into the ACU. See TEST #4a: Thermistors, page 3-16. |
| F3E2 | Moisture Sensor 1 Open/Shorted | Indicates the moisture sensor strip is open or shorted. This fault code will only appear when in the service diagnostic mode. See TEST #5: Moisture Sensor, page 3-19. |
| F3E3 | Inlet Thermistor Open/Shorted | Indicates that the inlet thermistor is open or shorted. If the temperature drops below 18° F (> 245k ohms), the inlet thermistor is open. If the temperature is above 391° F (< 328 ohms), the inlet thermistor has shorted. May occur if the J14 connector is not plugged into the ACU. See TEST #4a: Thermistors, page 3-16. |
| F3E5 | Moisture Sensor 2 Open/Shorted (only Quad Sense models) | Indicates the second moisture sensor strip is open or shorted. This fault code will only appear when in the service diagnostic mode. See TEST #5: Moisture Sensor, page 3-19. |
| F6E1 | ACU - HMI Communication Error | Indicates that the ACU and HMI have not communicated for a specified amount of time.  
  - Unplug dryer or disconnect power.  
  - Check the harness continuity and connections between the ACU and HMI.  
  - Check AC and DC supplies. See TEST #1: ACU Power Check, page 3-8.  
  - Replace the HMI.  
  - Replace the ACU. |
| F6E2 | | |
| FCE1 | WiFi Module Communications Lost | Indicates that the WiFi Module has not responded for a specified amount of time.  
  - Unplug dryer or disconnect power.  
  - Check WiFi Module at HMI.  
  - Replace HMI. |

**DANGER**

Electrical Shock Hazard
Only authorized technicians should perform diagnostic voltage measurements.
After performing voltage measurements, disconnect power before servicing.
Failure to follow these instructions can result in death or electrical shock.

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

---

**Voltage Measurement Safety Information**

When performing live voltage measurements, you must do the following:
- Verify the controls are in the off position so that the appliance does not start when energized.
- Allow enough space to perform the voltage measurements without obstructions.
- Keep other people a safe distance away from the appliance to prevent potential injury.
- Always use the proper testing equipment.
- After voltage measurements, always disconnect power before servicing.

---

**IMPORTANT: Electrostatic Discharge (ESD) Sensitive Electronics**

ESD problems are present everywhere. Most people begin to feel an ESD discharge at approximately 3000V. It takes as little as 10V to destroy, damage, or weaken the main control assembly. The new main control assembly may appear to work well after repair is finished, but a malfunction may occur at a later date due to ESD stress.

- Use an anti-static wrist strap. Connect wrist strap to green ground connection point or unpainted metal in the appliance

  -OR-

- Touch your finger repeatedly to a green ground connection point or unpainted metal in the appliance.

- Before removing the part from its package, touch the anti-static bag to a green ground connection point or unpainted metal in the appliance.

- Avoid touching electronic parts or terminal contacts; handle electronic control assembly by edges only.

- When repackaging main control assembly in anti-static bag, observe above instructions.

---

**IMPORTANT SAFETY NOTICE — “For Technicians only”**

This service data sheet is intended for use by persons having electrical, electronic, and mechanical experience and knowledge at a level generally considered acceptable in the appliance repair trade. Any attempt to repair a major appliance may result in personal injury and property damage. The manufacturer or seller cannot be responsible, nor assume any liability for injury or damage of any kind arising from the use of this data sheet.

Component Testing

TESTING DRYER COMPONENTS FROM THE CONTROL
Before testing any of the components, perform the following checks:

- The most common cause for mis-diagnosed control failure is poor connections. Therefore, disconnecting, inspecting and reconnecting wires will be necessary throughout test procedures.
- All tests/checks should be made with a VOM or DVM having a sensitivity of 20,000 ohms-per-volt DC, or greater.
- Check all connections before replacing components, looking for broken or loose wires, failed terminals, or wires not pressed into connectors far enough.
- Voltage checks must be made with all connectors attached to the boards.
- **IMPORTANT:** Resistance checks must be made with power cord unplugged or power disconnected, and with wiring harness or connectors disconnected from the control.

The testing procedures in this section may require the use of needle probes to measure voltage. Failure to use needle probes will damage the connectors.

TEST #1: ACU Power Check

This test is used to determine if power is present at the Appliance Control Unit (ACU). This test assumes that proper voltage is present at the outlet.

1. Verify that the green LED on the ACU is lit when the dryer is turned on.

**NOTE:** It is important to verify that the ACU is not in “Low Power” mode. If the HMI is working correctly, it will “wake up” the system after powering up and pressing Power. To verify, unplug dryer or disconnect power for 60 seconds. Plug in dryer or reconnect power. Press POWER. If the ACU comes up (i.e., the green LED on the ACU flashes and then stays lit after boot-up is complete), but the HMI does not, there may be a problem with the HMI.

2. Unplug dryer or disconnect power.

3. Check for appropriate line voltages at the outlet: 240 VAC (electric 2-phase), 208 VAC (electric 3-phase), or 120 VAC (gas).

   - If line voltage is present, go to step 4.
   - If line voltage is not present, check for tripped circuit breaker or blown household fuse. If CB (circuit breaker) is not tripped, have customer check with qualified electrician.

4. Remove top panel to access the machine electronics.

5. **ACU VAC** – With voltmeter set to AC, connect black probe to ACU J8-3 (N) and red probe to J9-2 (L1). (See Figure 1, page 3-9.) Plug in dryer or reconnect power.

   - If 120 VAC is present, unplug dryer or disconnect power and go to step 6.
   - If 120 VAC is not present, unplug dryer or disconnect power and perform TEST #2: Supply Connections, page 3-10.

6. **ACU +5 VDC** – With voltmeter set to DC, unplug connector J2 from the ACU and connect black probe to ACU J2-4 (ground) and red probe to J2-2 (+5 VDC). Plug in dryer or reconnect power.

   - If +5 VDC is present, go to step 9.
   - If +5 VDC is not present, go to step 7.

7. Unplug dryer or disconnect power. Unplug J14 from the ACU. Plug in dryer or reconnect power and repeat step 6.

   - If +5 VDC returns, one of the thermistors has shorted. To diagnose thermistors, see TEST #4a, page 3-16.
   - If +5 VDC is not present, go to step 8.

8. Unplug dryer or disconnect power. Reconnect J14 to the ACU and unplug J2 from the ACU. Plug in dryer or reconnect power and repeat step 6. Perform voltage check inside header J2 on ACU, between pins 2 & 4—DO NOT SHORT PINS TOGETHER.

   - If +5 VDC is still missing, unplug dryer or disconnect power and replace the ACU.
   - If +5 VDC returns, unplug dryer or disconnect power and check harnesses and connections between the ACU and HMI. If acceptable, replace the HMI.

9. **ACU +12.7 VDC** – with voltmeter set to DC, connect black probe to ACU J2-4 (ground) and red probe to J2-1 (+12.7 VDC). Plug in dryer or reconnect power.

   - If +12.7 VDC is present, go to step 11.
   - If +12.7 VDC is not present, go to step 10.

10. Unplug dryer or disconnect power. Unplug connector J2 from the ACU. Perform voltage check inside header J2 on ACU, between pins 1 & 4—DO NOT SHORT PINS TOGETHER.

    - If +12.7 VDC is still missing, unplug dryer or disconnect power and replace the ACU.
    - If +12.7 VDC returns, unplug dryer or disconnect power and check harnesses and connections between the ACU and HMI. If acceptable, replace the HMI.

11. Unplug dryer or disconnect power.

12. Reassemble all parts and panels.

13. Perform steps under “Service Diagnostic Mode,” page 2-4, to verify repair.

TROUBLESHOOTING TESTS

IMPORTANT:
The following procedures may require the use of needle probes to measure voltage. Failure to use needle probes will damage the connectors.

TEST #1: ACU Power Check

This test is used to determine if power is present at the machine control electronics. This test assumes that proper voltage is present at the outlet.

1. Verify that the green LED on the ACU is lit when the dryer is turned on.

   NOTE: It is important to verify that the system is not in “Low Power” mode. If the HMI is working correctly, it will “wake up” the system after powering up and pressing Power. To verify, unplug dryer or disconnect power for 60 seconds. Plug in dryer or reconnect power. Press POWER. If the ACU comes up (i.e., the green LED in the center of the ACU flashes and then stays lit after boot-up is complete) but the HMI does not, there may be a problem with the HMI.

2. Unplug dryer or disconnect power.

3. Check for appropriate line voltages at the outlet: 240VAC (electric 2-phase), 208VAC (electric 3-phase), or 120VAC (gas).

   ¾ If line voltage is present, go to step 4.

   ¾ If line voltage is not present, check for tripped circuit breaker or blown household fuse. If CB (circuit breaker) is not tripped, have customer check with qualified electrician.

4. Remove top panel to access the machine electronics.

5. ACU VAC – With voltmeter set to AC, connect black probe to ACU J8-3 (N) and red probe to J9-2 (L1) (see Figure 2). Plug in dryer or reconnect power.

   ¾ If 120VAC is present, unplug dryer or disconnect power and go to step 6.

   ¾ If 120VAC is not present, unplug dryer or disconnect power and perform TEST #2: Supply Connections, page 12.

**TEST #2: Supply Connections**

This test assumes that proper voltage is present at the outlet, and for U.S. installations, a visual inspection indicates that the power cord is securely fastened to the terminal block (electric dryer) or wire harness connection (gas dryer).

**ELECTRIC DRYER (U.S. Installations):**

1. Unplug dryer or disconnect power.
2. Remove the cover plate from the top right corner of the back of the dryer. See figure 1.

![Figure 1 - Remove the cover plate (appearance may vary).](image)

3. With an ohmmeter, check for continuity between the neutral (N) terminal of the plug and the center contact on the terminal block. See figure 2.
   - If there is no continuity, replace the power cord and test the dryer.
   - If there is continuity, go to step 4.
4. In a similar way, check which terminal of the plug is connected to the left-most contact on the terminal block and make a note of it. This will be L1 (black wire) in the wiring diagram. See figure 2.
   - When this is found, go to step 5.
   - If neither of the plug terminals have continuity with the left-most contact of the terminal block, replace the power cord and retest dryer.

5. Remove top panel. Access the machine electronics without disconnecting any wiring to the ACU.
6. With an ohmmeter, check for continuity between the L1 terminal of the plug (found in step 4) and J9-2 (black wire) on the ACU.
   - If there is continuity, go to step 7.
   - If there is no continuity, check that wires to the terminal block are mechanically secure. If so, replace the main wire harness and test the dryer.
7. Check for continuity between the neutral (N) terminal of the plug and J8-3 (white wire) on the ACU.
   - If there is continuity, go to step 8.
   - If there is no continuity, and the mechanical connections of the wire are secure, replace the main wire harness.
8. Visually check that ALL connectors are fully inserted into the ACU.
9. Visually check that ALL connectors are fully inserted into the HMI.
10. Reassemble all parts and panels.
11. Plug in dryer or reconnect power.
12. Perform steps under “Service Diagnostic Mode”, page 2-4, to verify repair.

**ELECTRIC DRYER (Canadian Installations):**

1. Unplug dryer or disconnect power.
2. Remove the cover plate from the top right corner of the back of the dryer. See figure 1.
3. Remove top panel. Access the machine electronics without disconnecting any wiring to the ACU.
4. With an ohmmeter, check the continuity from L1 and N plug terminals of the power cord to the terminals for L1 and N on the ACU. See figure 3, page 3-11.
   - If continuity exists for both connections, go to step 6.
   - If an open circuit is found, check the integrity of the connections of the power cord to the harness in the dryer; harness to the ACU; and the integrity of the power cord itself.
For Service Technician Use Only

GAS DRYER (U.S. and Canadian Installations):
1. Unplug dryer or disconnect power.
2. Remove the cover plate from the top right corner of the back of the dryer. See figure 1, page 3-10.
3. Check that the power cord is firmly connected to the dryer’s wire harness. See figure 4.

5. If it is necessary to replace the power cord, remove the retaining clip that secures the cord to the back panel. Disconnect the cord from the main harness and the ground wire from the rear panel, then pull out the power cord.
6. Visually check that ALL connectors are fully inserted into the ACU.
7. Visually check that ALL connectors are fully inserted into the HMI.
8. Reassemble all parts and panels.
9. Plug in dryer or reconnect power.

4. Remove top panel. Access the machine electronics without disconnecting any wiring to the ACU.
5. With an ohmmeter, check for continuity between the neutral (N) terminal of the plug and J8-3 (white wire) on the ACU. The left-hand side of figure 5 shows the position of the neutral terminal (N) on the power cord plug. Also see figure 1, page 3-9.
   - If there is continuity, go to step 6.
   - If there is no continuity, disconnect the white wire of the main harness from the power cord at the location illustrated in figure 4. Test the continuity of the power cord neutral wire as illustrated in figure 5. If an open circuit is found, replace the power cord. Otherwise, go to step 6.

6. In a similar way, check for continuity between the L1 terminal of the plug and J9-2 (black wire) on the ACU.
   - If there is continuity, go to step 7.
   - If there is no continuity, check the continuity of the power cord in a similar way to that illustrated in figure 5, but for power cord’s L1 wire.
   - If an open circuit is found, replace the power cord. Otherwise, replace the main harness.
7. Visually check that ALL connectors are fully inserted into the ACU.
8. Visually check that ALL connectors are fully inserted into the HMI.
9. Reassemble all parts and panels.
10. Plug in dryer or reconnect power.
11. Perform steps under “Service Diagnostic Mode”, page 2-4, to verify repair.
For Service Technician Use Only

Motor Circuit Check - Access the ACU and measure the resistance across J8-4 and J9-1.

- If resistance across J8-4 and J9-1 is in the range of 1 to 6 Ω, the motor circuit is acceptable. Replace the ACU.
- Otherwise, continue to step 6.

6. Check the wiring and components in the path between these measurement points by referring to the appropriate wiring diagram (gas or electric) on pages 3-4 to 3-7.

**NOTE:** To access motor system components, slide the top back and remove the front panel.

**ALL DRYERS:** Check the thermal fuse. See TEST #4b: Thermal Fuse, page 3-17.

**ALL DRYERS:** Continue with step 7 below to test the remaining components in the motor circuit.

7. Check the drive motor and belt switch (gas dryer only). Slowly remove the drum belt from the spring-loaded belt switch pulley, gently letting the pulley down. See figure 1.

8. Remove the white connector from the drive motor switch. See figure 2.

### TEST #3: Motor Circuit

This test will check the wiring to the motor and the motor itself. The following items are part of this motor system:

<table>
<thead>

<td>✔</td>
</tr>
</tbody>
</table>

**NOTE:** Refer to strip circuit on page 3-13 to diagnose the drive motor.

1. Unplug dryer or disconnect power.
2. Remove top panel to access the machine electronics.
3. Check for loose, worn, or damaged drum belt—repair as necessary.
4. Door Switch problems can be uncovered by following procedure under TEST #7: Door Switch, page 3-21; however, if this was not done, the following can be performed without applying power to the dryer. Connect an ohmmeter across ACU J8-3 (neutral, white wire) and J8-4 (door, tan wire).
   - With the door properly closed, the ohmmeter should indicate a closed circuit (0–2 Ω).
   - If not, check harnesses and connections between ACU and door switch. If good, replace the door switch assembly.
9. Remove the bare copper wire terminal from pin 5 of black drive motor switch. See figure 3.

   Main Winding:
   Lt. Blue Wire in Back
   and Bare Copper Wire

   Start Winding:
   Lt. Blue Wire in Back and
   Bare Copper Wire

   Figure 3 - Main and start winding measure points

10. Using figure 3 and the strip circuit below, check for the resistance values of the motor’s Main and Start winding coils as shown in the following table.

   NOTE: Main and Start winding coils must be checked at the motor.

<table>
<thead>
<tr>
<th>Winding</th>
<th>Resistance in ohms</th>
<th>Contact Points of Measurements</th>

</tr>
<tr>
<td>START</td>
<td>2.7–3.0</td>
<td>Blue wire in back at pin 4 and bare copper wire terminal on pin 3 of black drive motor switch</td>
</tr>
</tbody>
</table>

   If the resistance at the motor is correct, there is an open circuit between the motor and ACU. For gas models, check for a belt switch problem; see step 11. For electric models, check and repair the main wiring harness.

   If the Main or Start winding resistance is much greater or less than the values listed in the table above, replace the motor.

11. On gas dryer only: check the belt switch by measuring resistance between the two light blue wires in the belt switch connector block while pushing up the belt switch pulley.
   - If the resistance reading goes from open to a few ohms as pulley arm closes the switch, belt switch is good. If not, replace the belt switch.
   - If belt switch is good and there is still an open circuit, check and repair the main wiring harness.

12. Reassemble all parts and panels.
13. Plug in dryer or reconnect power.

**WARNING**

Electrical Shock Hazard
Disregard power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

**TEST #4: Heat System**

This test is performed when either of the following situations occurs:

- Dryer does not heat
- Heat will not shut off

This test checks the components making up the heating circuit. The following items are part of this system:

<table>
<thead>
<tr>
<th>Part of Heating System</th>

</tr>
</tbody>
</table>

**NOTE:** On the gas dryer, the inlet thermistor is located at the drum inlet vent. Refer to strip circuits on page 3-15 to diagnose heater system.

**Dryer does not heat:**

Locate the components using figures 1 and 2 on this page. To access heater system components, remove top and front panels.

**ELECTRIC DRYER ONLY:**

- Quick Check: Perform steps under “Service Diagnostic Mode”, page 2-4, to test for L1 and L2 line voltage.
  - If L1 is present, the heater relay is receiving L1 line voltage.
  - If L2 is present, the heater relay is receiving L2 line voltage, confirming that the centrifugal switch, heater, high limit thermostat, and the thermal cut-off are functional.

1. Unplug dryer or disconnect power.
2. Remove front panel to access thermal components.
3. Using an ohmmeter and referring to the strip circuit or wiring diagram, measure the resistance from the red wire terminal at the thermal cut-off to the red/white wire terminal at the heater.
   - If the resistance is about 10 Ω, go to step 5.
   - If an open circuit is detected, go to step 4.

4. Visually check the wire connections to the thermal cut-off, high limit thermostat, and heater. If the connections look good, check for continuity across each of these components. Refer to strip circuit on page 3-15.
For Service Technician Use Only

- Replace the heater if it is electrically open.
- Replace both the thermal cut-off and high limit thermostat if either the thermal cut-off or the high limit thermostat is electrically open.
- If no open circuit is detected, remove the J14 connector from the ACU and measure the outlet thermistor resistance between J14-3 and J14-6 at the connector. Refer to “Outlet Thermistor Resistance” table on page 3-16 for temperatures and their associated values.
- If the resistance corresponds to the temperature, the outlet thermistor is good. Go to step 6.
- If the thermistor resistance does not agree with the table, replace the outlet thermistor.
- If the preceding steps did not correct the problem and L1 and L2 were both detected, replace the ACU. If L2 was not detected, inspect the centrifugal switch before replacing the ACU.
- Reassemble all parts and panels.
- Plug in dryer or reconnect power.
- Perform steps under “Service Diagnostic Mode,” page 2-4, to verify repair.

GAS DRYER ONLY:
1. Verify the gas supply to the dryer is turned on.
2. Unplug dryer or disconnect power.
3. Perform TEST #4b: Thermal Fuse on page 3-17. If the thermal fuse is OK, go to step 4.
4. Perform TEST #4c: Thermal Cut-Off on page 3-17. If the thermal cut-off is OK, go to step 5.
5. Locate the high limit thermostat (see figure 2, page 3-14). Measure the continuity through it by connecting the meter probes to the red and black wire terminals.
- If there is an open circuit, replace both the high limit thermostat and the thermal cut-off.
- Otherwise, go to step 6.
6. Perform TEST #4d: Gas Valve on page 3-18. If the gas valve is OK, go to step 7.

7. If the preceding steps did not correct the problem, suspect the centrifugal switch before replacing the ACU.
8. Reassemble all parts and panels.
9. Plug in dryer or reconnect power.

Heat will not shut off:
ALL DRYERS:
1. Unplug dryer or disconnect power.
2. Remove top panel to access the machine electronics.
3. Remove connector J14 from the ACU and measure the resistance between J14-3 and J14-6 at the connector. Refer to “Outlet Thermistor Resistance” table on page 3-16, for temperatures and their associated values.
- If the resistance corresponds to the temperature, the outlet thermistor is good.
- If the thermistor resistance does not agree with the table, replace the outlet thermistor.
4. Check heater coil for a short to ground (usually inside the heater box). Repair or replace if necessary.
5. Plug in dryer or reconnect power.
6. Run an “AIR” only timed dry cycle (no heat). Check heater relay output on ACU. Unplug dryer or disconnect power. With a voltmeter set to AC, connect voltmeter to terminals 1 & 2 for heater relay. Plug in dryer or reconnect power. Measure the voltage across terminals 1 & 2.
- If voltage is present (~240 VAC for electric, ~120 VAC for gas), the relay is open and working normally.
- If little or no voltage is present, the relay is closed and heater is activated. Unplug dryer or disconnect power and replace the ACU.
7. Unplug dryer or disconnect power.
8. Reassemble all parts and panels.
9. Plug in dryer or reconnect power.

TEST #4a: Thermistors

NOTE: Refer to strip circuit below to diagnose outlet and inlet temperature thermistors.

Outlet (Exhaust) Thermistor

The ACU monitors the exhaust temperature using the outlet thermistor, and cycles the heater relay on and off to maintain the desired temperature. NOTE: Begin with an empty dryer and a clean lint screen.

1. Unplug dryer or disconnect power.
2. Remove top panel to access the machine electronics.
3. Remove connector J14 from the ACU and measure the resistance between J14-3 and J14-6 at the connector. The following table gives temperatures and their associated resistance values.

NOTE: All thermostat resistance measurements must be made while dryer is unplugged and connector removed from ACU.

- If the temperature is not reached within ~7 minutes, check voltage level and vent blockage, and then retest.
- If the temperature probe does not agree with temperature setting, replace the outlet thermistor.
- If the temperature probe confirms the temperature setting, retest at a different temperature setting.
- If the preceding steps did not correct the problem, replace the ACU.

Inlet Thermistor

NOTE: On the electric dryer, the inlet thermistor is part of the high thermostat assembly (see figure 1, page 3-15). On the gas dryer, the inlet thermistor is located at the drum inlet duct (see figure 1, page 3-3).
For Service Technician Use Only

The ACU monitors the inlet temperature using the inlet thermistor. The inlet thermistor (along with the outlet thermistor) is used to detect air flow, and assists in calculating load size.

1. Unplug dryer or disconnect power.
2. Remove the top panel to access the machine electronics.
3. Remove connector J14 from the ACU and measure the resistance between J14-1 and J14-2 at the connector. The following tables (electric & gas) give temperatures and their associated resistance values.

**NOTE:** All thermistor resistance measurements must be made while dryer is unplugged and connector removed from ACU.

- If the resistance is OK, the inlet thermistor is good. Proceed to step 4.
- If the thermistor resistance does not agree with the table, replace the inlet thermistor.

4. Check J14-1 and J14-2 to dryer cabinet ground. If either pin indicates continuity to ground (short), replace wiring harness; otherwise, proceed to step 5.
5. If the preceding steps did not correct the problem, replace the ACU.

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

---

**TEST #4b: Thermal Fuse**

**ALL DRYERS:** The thermal fuse is wired in series with the dryer drive motor.
1. Unplug dryer or disconnect power.
2. Remove top panel, front panel and bulkhead, and drum to access the thermal fuse.
3. Using an ohmmeter, check the continuity across the thermal fuse.
   - If the ohmmeter indicates an open circuit, replace the thermal fuse.

**TEST #4c: Thermal Cut-Off**

If the dryer does not produce heat, check the status of the thermal cut-off.
1. Unplug dryer or disconnect power.
2. Remove top panel, front panel and bulkhead, and drum to access the thermal cut-off.
3. Using an ohmmeter, check the continuity across the thermal cut-off. See figures 1 and 2, page 3-14, for location.
4. If the ohmmeter indicates an open circuit, perform the following:
   **ALL DRYERS:** Replace both the thermal cut-off and high limit thermostat. In addition, check for blocked or improper exhaust system, and, on electric dryers, for heat element malfunction.
For Service Technician Use Only

TEST #4d: Gas Valve (Gas Dryer)

1. Unplug dryer or disconnect power.
2. Access the gas valve by removing top panel, front panel, front bulkhead, and drum.
3. Use an ohmmeter to determine if a gas valve coil has malfunctioned. Remove harness plugs. Measure resistance across the terminals (see figure 1). Readings should match those shown in the following chart; if not, replace coils.

4. Disconnect the ignitor plug from the burner. Using an ohmmeter, measure the resistance across the ignitor’s 2-pin connector. Resistance should be 50-500 Ω.
   - If resistance readings are outside the range or open, replace the ignitor.
   - If resistance readings are within range, reconnect the ignitor plug and continue to step 5.
5. Disconnect the wires going to the flame sensor terminals. Using an ohmmeter, measure across the two sensor terminals for continuity.
   - If there is continuity, reconnect the sensor wires and continue to step 6.
   - If the reading is open, the flame sensor needs replacing.
6. Reassemble all parts and panels before reconnecting power.
7. Plug in dryer or reconnect power.
8. Run a high-temp TIMED DRY cycle of at least 2 minutes in duration.
9. Watch the ignitor for a couple of minutes through the “peek window” in the side. If the ignitor stays red hot and the gas does not come out and ignite, the flame sensor needs replacing.
   - NOTE: If ignitor does not come on, line voltage may not be present at the gas burner. The motor centrifugal switch may be suspect.
   - IMPORTANT: To avoid damage to the gas burner wire harness, ensure the harness is routed exactly as it was prior to service.
10. Unplug dryer or disconnect power.
11. Reassemble all parts and panels.
12. Plug in dryer or reconnect power.
13. Perform steps under “Service Diagnostic Mode”, page 2-4, to verify repair.

Gas Valve Schematic

![Figure 1 - Measuring gas valve resistance.](image1)

![Figure 2 - Gas Valve Schematic](image2)
For Service Technician Use Only

NOTE: Overdrying may be caused by a short circuit in the sensor system.

3. Unplug dryer or disconnect power.
4. Remove top panel to access the ACU.
5. Access the moisture sensor wires by removing the console and front panel (see pages 4-9 & 4-11). Disconnect the 3-wire moisture sensor connector located below the door opening between the front panel and bulkhead.
6. Access the ACU and remove connector J13 from the ACU. Check the wire harness for continuity between J13 and the moisture sensor connector.
   - If there is continuity, go to step 7.
   - If there is no continuity, replace the main harness.
7. Measure the resistance across the outermost contacts of the connector that includes the two MOVs.
   - If a small resistance is measured, clean the two metal moisture strips inside the drum. If a small resistance is measured after cleaning, replace sensor harness.
   - If a small resistance is not measured, go to step 8.
8. Measure the resistance across each of the outermost contacts and the center terminal (ground connection).
   - If a resistance less than infinity is measured, replace the sensor harness.
9. If the moisture sensor diagnostic test passes, check the outlet thermistor: TEST #4a, page 3-16.
10. If the preceding steps did not correct the problem, replace the ACU.

NOTE: Some Maytag models have an additional set of moisture sensors located at the back of the drum. To test the rear moisture sensor, repeat steps 6-10, using connector J23.

COMPONENT TESTING

For Service Technician Use Only

TEST #6: Buttons and Indicators

This test is performed when any of the following situations occurs during the “Key Activation & Encoder Test” (see page 2-5).

- None of the indicators or display turn on
- Some buttons do not light
- No beep sound is heard

None of the indicators or display turn on:

1. Unplug dryer or disconnect power.
2. Remove top panel to access the ACU and HMI.
3. Visually check that ALL ACU connectors are inserted all the way into the ACU.
4. Visually check that ALL HMI connectors are inserted all the way into the HMI.
5. Visually check that the HMI and housing assembly is properly inserted into the front console.
6. If all visual checks pass, perform TEST #1: ACU Power Check, page 3-8, to verify supply voltages.
   - If supply voltages are present, replace the HMI and housing assembly.
   - If supply voltages are not present, replace the ACU.
7. Reassemble all parts and panels.
8. Plug in dryer or reconnect power.
9. Perform the “Key Activation & Encoder Test” (see page 2-5) to verify repair.

Some buttons do not light:

1. Unplug dryer or disconnect power.
2. Remove top panel to access the ACU and HMI.
3. Visually check that the HMI and housing assembly is properly inserted into the front console.
4. If visual check passes, replace the HMI and housing assembly.
5. Reassemble all parts and panels.
6. Plug in dryer or reconnect power.
7. Perform the “Key Activation & Encoder Test” (see page 2-5) to verify repair.

No beep sound is heard (on some models, only the Normal cycle beeps upon cycle selection):

1. On some models, verify that the “Cycle Signal” volume is turned on. (Procedure varies by model; refer to Use & Care Guide for specific instructions to adjust cycle signal.)
2. Unplug dryer or disconnect power.
3. Remove top panel to access the ACU and HMI.
4. Visually check that ALL ACU connectors are inserted all the way into the ACU.
5. Visually check that ALL HMI connectors are inserted all the way into the HMI.
6. If all visual checks pass, replace the HMI and housing assembly.
7. Reassemble all parts and panels.
8. Plug in dryer or reconnect power.
9. Perform the “Key Activation & Encoder Test” (see page 2-5) to verify repair.

WARNING

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

3-20 ■ Whirlpool & Maytag Front-Load Dryers
TEST #7: Door Switch

NOTE: Refer to strip circuit below to diagnose the door switch. Functionality is verified when opening the door turns on the drum light. Closing the door should turn off the drum light.

If the preceding conditions are not met:
1. Unplug dryer or disconnect power.
2. Remove console to access the machine electronics.
3. Check that the wires between the door switch and ACU are connected. (Refer to wiring diagrams on pages 3-4 to 3-7.)
   - If the connections are good, replace the wire and door switch assembly and retest.
   - If wire and door switch assembly have been replaced and dryer still does not start, replace the ACU.
4. Reassemble all parts and panels.
5. Plug in dryer or reconnect power.
6. Verify that the dryer will start with the door closed, and that it stops when the door opens.

DOOR SWITCH STRIP CIRCUIT

COMPONENT TESTING

For Service Technician Use Only

DANGER

Electrical Shock Hazard

Only authorized technicians should perform diagnostic voltage measurements.
After performing voltage measurements, disconnect power before servicing.
Failure to follow these instructions can result in death or electrical shock.

TEST #8: Drum LED

NOTE: Refer to the Drum LED circuit at right (Figure 2) to diagnose the drum LED.
This test is performed if the drum LED does not light when the dryer door is first opened.
1. Unplug dryer or disconnect power.
2. Remove the top panel to access ACU and HMI.
3. Verify that the drum LED connector J6 is securely connected to the ACU (see Figure 1).
4. Check harness and inline connections between the drum LED and ACU.
5. Unplug the drum LED connector J6 from the ACU.
6. With a multimeter set to milliamps, connect multimeter to ACU connector J6, pins 1 and 3. Plug in dryer or reconnect power. Open the door. Measure the current across ACU connector J6, pins 1 and 3. If the drum LED driver is working properly, there should be a measurement of 150-370 mA.
7. Reassemble all parts and panels.

DRUM LED CIRCUIT

Figure 1 - Drum LED Connector

Figure 2 - Drum LED Strip Circuit
TEST #9: Water Valve (on some models)

Activate Service Diagnostic Mode (see page 2-4). Perform Step 8 in Service Test Mode Chart (see page 2-6). Verify that water is being sprayed into the drum. See Figure 1.

NOTE: Refer to the strip circuit below (Figure 2) to diagnose water valve.

If water leaks from the dryer/too much water being sprayed into the drum:
1. Inside the drum, unscrew the water nozzle.
2. Inspect nozzle opening for residue buildup; clean or replace it.

If no water is sprayed in the drum:
1. Verify that water is hooked up and turned on.
2. Unplug dryer or disconnect power.
3. Remove top panel to access the ACU.
4. Verify that the red wire coming from the water valve is connected to the ACU, J8-1. Refer to wiring diagrams on pages 3-4 to 3-7, or the strip circuit below.

If water does not dispense, go to step 7.

1. Inside the drum, unscrew and replace the water nozzle assembly (see Figure 13).
2. Check that the hose and wires are connected to the water valve assembly (see Figure 1).
3. Check that the water valve assembly hose is connected to the nozzle.
4. If everything is connected and the water still does not dispense:
   - Unplug dryer or disconnect power.
   - Replace the valve assembly and retest.
5. Check Water Valve & Harness—using an ohmmeter, measure the resistance between the ACU J8-1 (red wire) and J9-2 (black wire).
   - If the resistance is 510–590 Ω, go to step 6; if not, replace the water valve.
   - If an open circuit is detected, go to step 7.
6. Inside the drum, unscrew and replace the water nozzle using a 7/16” wrench or socket. Retest water valve.
   - If water does not dispense, go to step 7.
7. Access the water valve by removing the back panel.
   - Check that the hose and wires are connected to the water valve assembly (see Figure 1).
   - Check that the water valve assembly hose is connected to the nozzle.
8. If the preceding steps did not correct the problem, replace the ACU.

Door Reversal — Round-Shaped Doors

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

**Door Reversal**

The following instructions are for models with round-shaped doors.

**REVERSE DOOR SWING: ROUND-SHAPED DOOR**

DOORS WITH ELECTRICAL WIRING:

2. Using a T25® screwdriver, remove the four screws securing the door hinge to the dryer and lift the door up and out to remove. Place the door on a soft towel or other non-scratch surface.

3. Using a T25® screwdriver, remove the two screws securing the door strike to the door frame of the dryer. Rotate the strike 180° and attach to the opposite side of dryer door frame with the two screws removed earlier, as shown.

**Figure 1 - Disconnect wiring from door.**

**Figure 2 - Remove door from dryer.**

**Figure 3 - Move the door strike.**
4. Position the door with the inside of the door facing up. Using a Phillips screwdriver, remove the 10 screws securing the inner door to the outer door.

5. Using a T20® screwdriver, remove the six screws holding the hinge assembly in place.

6. Flip and rotate the inner door 180° so that the thin section is at the top and the thick section is at the bottom. Using a T25® screwdriver, remove the four screws securing the latch plate in place.

7. Using a T25® screwdriver, reinstall the latch plate on the opposite side from which it was removed with the four screws removed earlier.
8. Flip over the inner door to the left. Using a T20® screwdriver, reinstall the hinge assembly on the opposite side from which it was removed.

DOORS WITH ELECTRICAL WIRING:

9. Lift off inner door assembly. Using a Phillips screwdriver, remove the two screws securing the rotating assembly to the door.

10. Reposition rotating assembly and tubing 180° to opposite side of the door.

11. Rotate bottom of assembly 180° towards you and secure assembly with the two screws removed earlier, using a Phillips screwdriver. Press tubing into indents. IMPORTANT: Make sure to swing hinge down in front of rotating assembly (see Step 12).
Door Reversal — Round-Shaped Doors (continued)

ALL DOORS:

12. Position the door with the inside of the door facing up. Using a Phillips screwdriver, reinstall the 10 screws removed earlier, securing the inner door to the outer door.

DOORS WITH ELECTRICAL WIRING:

14. Plug in wire. Using a Phillips screwdriver, secure the rotating assembly to the hinge with the screw removed earlier.

13. Doors with electrical wiring: Pull the wire through the front panel opening before reinstalling the door. Insert the tabs on the hinge into the mounting slot and slide down to engage the top tab. Secure in place with the four T25® screws removed earlier.
Door Reversal — Square-Shaped Doors

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

Door Reversal

The following instructions are for models with square-shaped doors.

**REVERSE DOOR SWING: SQUARE-SHAPED DOOR**

1. Using a T25® screwdriver, remove the four screws securing the door hinge to the dryer and lift up and out to remove the door. Place the door on a soft towel or other non-scratch surface. Retain or set aside the four screws.

2. Using a T25® screwdriver, remove the two screws securing the door strike to the door frame of the dryer. Remove the four screws above and below the door strike and set aside for later use. Rotate the strike 180° and attach to the opposite side of dryer door frame, as shown.

3. Position the door with the inside of the door facing up. Using a Phillips screwdriver, remove the 13 screws securing the inner door to the outer door. Lift off the inner door and set aside.

   **NOTE:** There is a small release tab on each side of the door. If the inner and outer door do not separate easily, slide a credit card, putty knife, or similar flat object between the inner and outer doors at the locations shown to release the tab.

Door Reversal — Square-Shaped Doors (continued)

4. Using a T25® screwdriver, remove the three screws securing the latch plate and the five screws holding the hinge assembly in place.

Figure 4 - Remove hinge and latch from inner door.

5. Using a T25® screwdriver, reinstall the latch plate and hinge assembly on the opposite sides from which they were removed.

Figure 5 - Reinstall hinge and latch on opposite sides.

6. Position the inner door on the outer door assembly. Using a Phillips screwdriver, secure with the 13 screws removed earlier.

Figure 6 - Reattach inner door to outer door.

7. Using a T25® screwdriver, reinstall the four screws securing the door hinge to the dryer.

Figure 7 - Reattach door to dryer.
Removing the Top Panel & Console/HMI

To Remove the Top Panel

1. Unplug dryer or disconnect power.
2. Remove the two (2) 5/16” hex-head screws from the back of the top panel as illustrated in Figure 1.
3. Lift the rear of the top panel, pull back, and remove top panel from the dryer.

To Remove the Console/Human-Machine Interface

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel” prior to performing the following steps.
3. Disconnect the Human-Machine Interface (HMI) connector from the Appliance Control Unit (ACU). See Figure 1.
4. Detach one harness clip from the console bracket (see Figure 2).
5. Using a 1/4” nut driver, remove two (2) hex-head screws, one on each side of the console top as shown in Figure 2.
6. Gently lift up on the four (4) console tabs as shown in Figure 3. Separate console assembly from bracket while routing the HMI harness through the opening in the console bracket.
**Removing the Appliance Control Unit (ACU)**

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

To Remove the Appliance Control Unit (ACU)

**IMPORTANT:** Electrostatic Discharge (ESD) Sensitive Device. Failure to follow the ESD precautions outlined at the beginning of Section 3 “Testing” may destroy, damage, or weaken the main control assembly.

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel” prior to performing the following steps.
3. Disconnect all connectors from the ACU (see Figure 1).
4. Using a 1/4” nut driver, remove the one (1) hex-head screw securing the ACU to the left-side panel (location circled in Figure 2).
5. Slide the ACU towards the rear of the dryer to disengage tabs from the side panel. Remove Appliance Control Unit.

To Remove the Front Panel & Door Switch

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel & Console/HMI” prior to performing the following steps.
3. Perform the procedures on page 4-3, “Removing the Door Assembly” prior to performing the following steps.
4. Disconnect the door switch “inline” connector as shown in Figure 1.
5. Remove four (4) 1/4” hex-head screws from the bottom of the front panel (see Figure 3).
6. Open dryer door and remove the lint screen. Next, remove the two (2) Phillips screws below the dryer door (see Figure 3).
7. Remove three (3) 1/4” hex-head screws from the top of the front panel (see Figure 3).
8. Lift the front panel assembly up off the tabs and away from the dryer. Route the door switch harness around the front console bracket.
9. Locate the door switch on the backside of the front panel, just above the door opening. Depress both tabs and push switch through the opening. (See Figure 4.)

NOTE: Refer to Figure 3 for the following 2 steps.

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

COMPONENT ACCESS

Removing the Drum Light & Moisture Sensor

To Remove the Drum Light

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel & Console/HMI” prior to performing the following steps.
3. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.
4. If not done already, unplug connector J6 from the ACU.
5. Unclip the harness clip shown in Figure 1.

6. Depress the tabs on both sides of the drum light to release from bulkhead. Route the light and harness assembly through the hole (see Figure 2).

To Remove the Moisture Sensor

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel & Console/HMI” prior to performing the following steps.
3. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.
4. Open dryer door and remove the lint screen.

NOTE: Refer to Figure 3 for the following 3 steps.
5. Disconnect Moisture Sensor connector (see Figure 3).
6. From inside the drum, remove two (2) 1/4” hex-head screws securing the Outlet Grill & Housing Assembly to the front bulkhead (see Figure 3).
7. Lift up and remove the Outlet Grill & Housing Assembly from the bulkhead (see Figure 3).

8. Remove the harness from the moisture sensor strips (see Figure 4).

9. Separate the Outlet Grill & Housing Assembly to access and remove the moisture sensor strips. See Figure 5.
Removing the Belt, Drum, and Rollers

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

To Remove the Belt and Drum

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel and Console/HMI” prior to performing the following steps.
3. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.
4. Remove two (2) 1/4” hex-head screws from the top of the console bracket and two (2) from the front of the bracket. Remove console bracket and set aside for reinstallation (see Figure 1).
5. Disconnect Moisture Sensor connector (see Figure 2).
6. Remove the three (circled) 1/4” hex-head screws from the lint duct as illustrated in Figure 3. Swivel the lint duct down from the bulkhead and remove.

**Figure 1 - Remove console bracket screws.**

**Figure 2 - Disconnect moisture sensor connector.**

**Figure 3 - Remove lint duct screws.**
Removing the Belt, Drum, and Rollers (continued)

7. Remove the four (4) 1/4" hex-head screws securing the front bulkhead to the side panels as illustrated in Figure 4. Lift the bulkhead up off the side-panel tabs and remove.

Reassembly Note - Belt Orientation on Pulley

8. Reach under the drum, (raise it as far as it will go), and push the idler pulley arm, on the back of the drive motor, to the left to relieve the tension on the belt, then remove the belt from the pulley.

9. Slide the belt off the front of the drum and remove belt.

To Remove a Roller

1. Pry the sides of the triangular ring out of the groove in the roller shaft with a small screwdriver (see Figure 7).

2. Slide the roller off the roller shaft (see Figure 8).

3. To remove the roller shaft, remove the 9/16" nut and washer from the roller support, and remove the support and remaining triangular ring. See Figure 9.

10. Lift the drum and remove it from the dryer cabinet.
Removing the Drive Motor

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

To Remove the Drive Motor

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel and Console/HMI” prior to performing the following steps.
3. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.
4. Perform the procedures on page 4-13, “Removing the Belt and Drum” prior to performing the following steps.
5. Using a 1/4” nut driver, remove the one (1) hex-head screw securing blower wheel shield to blower housing (see Figure 1).

6. Reach around to the back of the blower housing and attached a 7/16” open-end wrench to the hex-end of the motor shaft. Insert a 1/2” ratchet drive into the blower wheel square hole (see Figure 2).
7. Turn the blower wheel clockwise (shown by the “REMOVE” arrow that is embossed on the front of the wheel) and remove the wheel from the motor shaft (see Figure 2).

8. Lift the locking tabs on the top and bottom of the motor harness plug and disconnect the plug from the motor terminals. See Figure 3.

9. Locate the front and rear motor clips as illustrated in Figure 4 below. Using a small flat blade screwdriver, insert the blade of the screwdriver into the pocket at the tip of the clip. Pry the clips off the tab and remove.

10. Lift motor from support brackets, slide shaft from blower wheel housing and remove motor from cabinet.
To Remove the Thermal Fuse & Outlet Thermistor

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel and Console/HMI” prior to performing the following steps.
3. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.
4. Remove the three (3) 1/4” hex-head screws from the lint duct as illustrated in Figure 1. Swivel the lint duct down and remove.

5. Disconnect the two wire connectors from the thermal fuse or outlet thermistor terminals (see Figure 2).
6. Remove the screw(s) from the thermal fuse or outlet thermistor and remove the component from the blower housing (see Figure 2).
To Remove the Heater, High Limit Thermostat & Thermal Cutoff (Electric Models Only)

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel and Console/HMI” prior to performing the following steps.
3. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.

4. Remove the screws from the heater shield/support and remove heat shield/support (see Figure 2).

5. To Remove the Heater (see Figure 3):
   a) Remove the two (2) wires from the heater terminal block.
   b) Remove the 1/4” hex-head screw from the heater housing and slide the heater out of the heater duct.

6. To remove the High Limit Thermostat or Thermal Cutoff (see Figure 3):
   a) Disconnect the wires from the High-Limit Thermostat or Thermal Cutoff.
   b) Remove the screw(s) from the High-Limit Thermostat or Thermal Cutoff and remove the component from the heater duct.
Removing the Ignitor, Flame Sensor, High-Limit Thermostat and Thermal Cutoff (Gas Models Only)

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

To Remove the Ignitor, Flame Sensor, High-Limit Thermostat and Thermal Cutoff

1. Unplug dryer or disconnect power.
2. Turn off gas supply to dryer.
3. Perform the procedures on page 4-9, “Removing the Top Panel and Console/HMI” prior to performing the following steps.
4. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.

5. To remove the Ignitor (see Figures 2 & 3):
   a) Disconnect the ignitor wire connector from the main harness.
   b) Remove the 5/16” hex-head ignitor bracket screw from the burner venturi and remove the ignitor and bracket.
   c) Remove the 5/16” hex-head ignitor screw and remove the ignitor from the bracket.
Removing the Ignitor, Flame Sensor, High-Limit Thermostat and Thermal Cutoff (continued)

6. To remove the Flame Sensor (see Figure 4):
   a) Disconnect the two (2) wire connectors from the flame sensor terminals.
   b) Remove the flame sensor screw from the burner venturi and remove the sensor.

7. To remove the High-Limit Thermostat or the Thermal Cutoff (see Figure 5):
   a) Disconnect the two (2) wire connectors from the component terminals.
   b) Remove the two (2) screws from the High-Limit Thermostat, or the single screw from the Thermal Cutoff. Remove the component from the venturi.
Removing the Gas Burner Assembly Coils (Gas Models Only)

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

To Remove the Gas Burner Assembly Coils

1. Unplug dryer or disconnect power.
2. Turn off gas supply to dryer.
3. Perform the procedures on page 4-9, “Removing the Top Panel and Console/HMI” prior to performing the following steps.
4. Perform the procedures on page 4-11, “Removing the Front Panel” prior to performing the following steps.
5. Remove the ignitor from the burner (see page 4-18 for the procedure).
6. Disconnect the 2-wire and 3-wire connectors from the burner coil assembly terminals (see Figure 3).
7. Remove the two screws from the burner support bracket and remove the bracket from the burner (see Figure 3).
8. Remove the two screws from the front of the burner bracket and remove the burner assembly from the dryer.
9. Remove the one (1) Phillip screw, indicated in Figure 4, to release the coil pack.
10. Lift and remove the coil pack from the valve assembly. See Figure 5.
Removing the Rear Panel

**WARNING**

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating.
Failure to do so can result in death or electrical shock.

To Remove the Rear Panel

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-9, “Removing the Top Panel” prior to performing the following steps.
3. Using a 1/4” nut driver, remove the two (2) hex-head screws securing the rear bracket to the rear panel as indicated in Figure 1. Remove the rear bracket.
4. Remove the 5/16” hex-head screw securing the terminal block cover to the rear panel. Remove the cover (see Figure 2).
5. Remove the ten (10) 1/4” hex-head screws securing the rear panel to the dryer (see Figure 3).
6. Lift up rear panel slightly to disengage from base and remove from dryer.
Removing the Water Valve (Steam Models Only)

To Remove the Water Valve

1. Unplug dryer or disconnect power.
2. Perform the procedures on page 4-21, “Removing the Rear Panel” prior to performing the following steps.
3. Disconnect the water valve harness connector (see Figures 1 & 2).
4. Remove the “C-Clip” from the water valve tube fitting and remove water tube from valve assembly (see Figures 1 & 2).
5. Remove the 1/4” hex-head screw securing the water valve bracket to the dryer base. Remove water valve and bracket assembly from dryer. See Figures 1 & 2.

Electrical Shock Hazard
Disconnect power before servicing.
Replace all parts and panels before operating. Failure to do so can result in death or electrical shock.

Internet Connectivity Guide

Get the App and Get Connected

With your mobile device, get the app, connectivity setup instructions, terms of use, and privacy policy at: www.whirlpool.com/connect

In Canada, visit www.whirlpool.ca/connect

and click on the Whirlpool® Connected Appliances link.

INITIAL SET UP

IMPORTANT: Proper installation of the appliance prior to use is the customer responsibility. Be sure to read and follow the Installation Instructions that came with the appliance.

Connectivity requires WiFi and account creation. App features and functionality subject to change. Data rates may apply. If you have any problems or questions, call Whirlpool Corporation Connected Appliances at 1-866-333-4591.

You Will Need:

- A home wireless router supporting:
  - Frequency Band: 2.4GHz Band IEEE 802.11 b/g/n
  - Security: WiFi Protected Access WPA2
  - Network Support: IPV4 Minimum

- The router to be ON and have a live internet connection.
- The 10-character Smart Appliance ID (SAID) code for your appliance. The SAID code is either printed on a label on the appliance or can be found on the LCD screen. Refer to the appliance Use & Care Guide for the location.

Download and Install with Touch Screen

Perform the following steps to download and install the App. Once installed, launch the app. You will be guided through the steps to set up a user account and to connect the appliance. If you have any problems or questions, call Whirlpool Corporation Connected Appliances at 1-866-333-4591.

1. Download the Mobile App.
   From your mobile device, smartphone, or tablet, go to www.whirlpool.com/connect and follow the instructions to download and install the Whirlpool® app.

2. Create Your Own Account.
3. Select Add Appliance on the Mobile Application.
4. Scan the QR code from the Appliance WiFi settings touchscreen display.
5. Follow Mobile Application instructions to use the Appliance touchscreen to select your home router and enter your home router passphrase on the appliance touchscreen.
6. Select next on the Mobile Application instruction Screen.
7. On the Mobile application observe and wait for the Appliance to indicate that it is connected to the home router, Internet, and Cloud Service.
8. Upon Success name your appliance and start using its remote features.

Download and Install with non-Touch Screen

Perform the following steps to download and install the App. Once installed, launch the app. You will be guided through the steps to set up a user account and to connect the appliance. If you have any problems or questions, call Whirlpool Corporation Connected Appliances at 1-866-333-4591.

1. Download the Mobile App.
   From your mobile device, smartphone, or tablet, go to www.whirlpool.com/connect and follow the instructions to download and install the Whirlpool® app.
2. Create Your Own Account.
3. Select Add Appliance on the Mobile Application.
4. Scan the QR code from the Appliance Label or manually enter the SAID and MAC.
5. On the Mobile Application enter your home router passphrase (if your home router has a choice of frequency bands - be sure to use the 2.4GHz band router name).
6. Select next on the Mobile Application instruction Screen.
7. On the Mobile application observe and wait for the Appliance to indicate that it is connected to the home router, Internet, and Cloud Service.
8. Upon Success name your appliance and start using its remote features.

NOTES:

- Once the dryer is connected to the consumer’s home WiFi network, it will remain linked even if the power goes out, the appliance is moved, or if it is put in storage for a while.
- If the consumer replaces their wireless router (or get a different Smart Dryer), you will need to repeat this connectivity setup process.
